the advantage in sports surfaces

How many tennis legends, still improving after fifty years in the game, will be seen on court throughout Australia for decades to come? One – and that player will be Plexipave, the top seed in acrylic tennis court surfacing systems.

A performer of consistently high standard and endurance, Plexipave is the most popular tennis court surface in the world. In fact, with talent to burn, it is a champion in a number of other sports as well, including netball, cycling and multi sport courts.

# Plexipave Tennis - the advantage in sports surfaces

## What is Plexipave?

Plexipave is an acrylic, multi-layer coating system. It is generally applied in three coats, with each contributing a specific quality to the whole. For example, speed of play can be adjusted by the amount of sand used in the finishing coat. The final product is a durable, richly coloured surface of uniform texture, suitable for both indoor and outdoor venues. In tennis, Plexipave is the ideal partner. It reacts to bounce and spin in a true and consistent way, its predictable grip and traction allow sure footing, and its anti-glare finish enhances visibility.

The rounded sand used in its smooth-textured surface dramatically reduces ball and shoe wear. Temperatures on a Plexipave court are 5-7°C lower than those on asphalt or concrete surfaces.

## Customisation

As every sports venue is subject to unique climatic and environmental conditions, as well as particular clientele needs and expectations, Plexipave can be customised to suit specific requirements. For every installation, the system of layers is engineered to provide the optimum surface, in terms of performance, durability and maintenance.

Plexipave can be applied over asphalt or concrete, or used to upgrade existing acrylic court surfaces. The nature and number of layers applied is determined by the desired effect. For example, Plexicushion underlay may be used to provide greater player comfort. Plexicushion dynamically responds to body impact and reduces fatigue on players' legs, ankles and feet. A range of ten long-lasting Plexipave colours is available. Plexicolour acrylic line paint can be used to apply the finishing touch to a court. It produces non-glare, non-chalking lines, which are textured to ensure uniform ball bounce.

## Durability

Once installed, Plexipave's smooth, uniform surface remains fixed in time for many years. Applied with a squeegee, it is free of the joins and weak spots that make other surfaces vulnerable to weather and deterioration. Its colours don't fade under UV light and it doesn't deteriorate in areas subject to full sun.

Plexipave dries quickly after rain. It breathes without losing its bond with the original surface beneath, and prevents this base from breakdown and deterioration.

Easy and economical to maintain, Plexipave requires no bagging or rolling. It may be cleaned with water and mild detergents. After many years, Plexipave can be renewed without the cost of having to completely remove the old surface.

## Installation

Plexipave is supported by an international network of authorised applicators. These specialists share their commitment to quality with a highly skilled customer service team, ensuring every installation process is as smooth as the product itself. The supply and installation of Plexipave is fully guaranteed.

## History

Australian Plexipave is 100% Australian owned, and to date has surfaced in excess of 10,000 courts across Australia and New Zealand. The company came into being in 1971, the offspring of parent company, Californian Products Corporation, a prime innovator in the court surfacing industry, and leading contributor to the development of acrylic surface technology. In 1953, Californian Products Corporation introduced the world's first completely acrylic surfacing system. Today, Plexipave dominates markets in the USA, UK, Sweden and Australia. Considering the company's on-going research and

development operations, which demonstrate a commitment to the development of healthy, environmentally friendly products, Plexipave is set to be number one seed well into the future.

**Plexipave, chosen by Tennis Australia as their surface of choice for the Australian Open Series and as the ideal training surface for future Australian champions.**
