

# POLYFLEX softfall

- Low maintenance
- Extremely durable
- Internationally recognised for quality and performance
- Outstanding cushioning for use in children's playgrounds
- Water permeable

SUPPLIERS AND INSTALLERS OF QUALITY PLAYGROUND SURFACES

# POLYFLEX softfall surfacing systems: safer playgrounds for children.

Like all POLYFLEX products our playground surfacing systems are made to the highest standards. The system is mixed and poured on site by fully trained and experienced local applicators backed by a company with a reputation of over 125 years.

The 1956 Olympic Games were the catalyst for Wm. Loud to expand its field of endeavours, to include a large range of synthetic surfaces. POLYFLEX softfall was developed by a world leader in surfacing systems and was introduced in 1989. Since then Wm. Loud has been a leader in the construction of playground safety systems.

## SOFTFALL: FOR THOSE HARD DECISIONS

Softfall is now installed in children's playgrounds throughout the world, and in all climatic conditions. Due to its porous nature POLYFLEX softfall allows playground equipment to be used immediately after even the heaviest rainfall. The system surface will not compact, blow or wash away, decompose or hold puddles.

Softfall can be installed to any required depth allowing users to design for the severity index drop height requirements for surfacing under specific items of play equipment.

The POLYFLEX system can easily be installed directly over an existing asphalt or concrete area, normally with little or no prior treatment to the existing surface. The surface can easily be installed around existing play equipment and awkwardly shaped surfaces.

## WHY CHOOSE SOFTFALL?

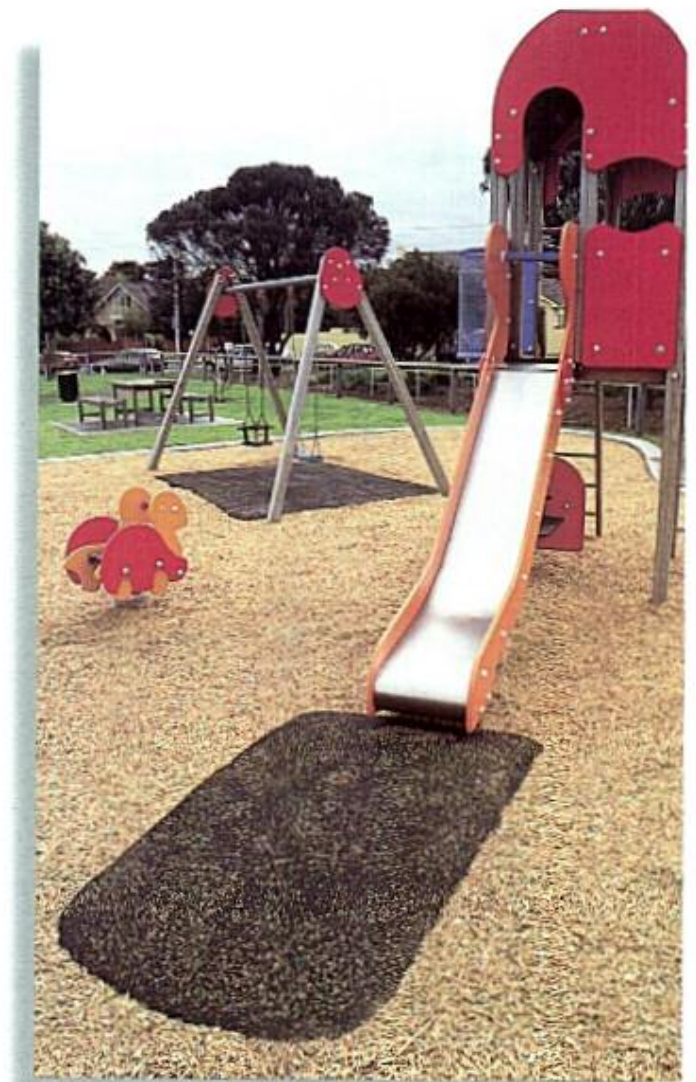

The EPDM or fibre rubber which forms the surface of the system are extremel hardwearing and have very good UV resistance. The rubber comes in black and several colours allowing for differentiation of particular sections within a playground area.

POLYFLEX softfall playground surfacing is seamless and jointless and consists of a unique single component polyurethane resin binder which is combined with rubber shred to form a highly shock absorbent base layer. Add to this a 15mm (minimum) surface layer of EPDM or fibre rubber bound together with the same single component polyurethane resin binder for safe, clean, low-maintenance playground surfaces.

## PERSONALISING YOUR PLAYGROUND

When considering your playground area design, POLYFLEX softfall offers the added advantage of allowing the application of a theme. With the range of coloured EPDM or fibre rubber available, your playground can be personalised to suit your surroundings.

Corporate or school logos, coloured games zones or eye-catching patterns can enhance the appeal of your play areas along with the proven maintenance and safety factors.

## POLYFLEX IS FLEXIBLE

Polyflex systems are also suitable for poolside surrounds, designated games areas, walkways and bike tracks. In fact, almost anywhere a safe, quiet, clean, moisture permeable, slip-free surface is required.

# Major advantages of POLYFLEX softfall surfacing systems.

Along with the considerable cost advantages in choosing the softfall surface system comes the peace of mind that this strong and extremely durable, clean and safe surface will last retaining full depth of colour without requiring costly, periodical resurfacing.

POLYFLEX has been synonymous with high performance sporting surfaces for more than a decade. The technology which led to the development of POLYFLEX surfaces is the basis for the outstanding performance and safety characteristics of this surfacing system.

## EASE OF INSTALLATION

The system is installed using a 'wet pour' process, effectively creating a large mat covering the required areas without any problem seams or joins. POLYFLEX softfall is a safer, cleaner option for playground areas.

### LOCAL AGENT:

**Court Craft (Australia) Pty Limited**  
127 Porters Road  
Kenthurst, NSW 2156
